

A Completed windows retaining all output IQ**B Full bytes + PC payload CRC**

Actual stationary board-pair measurements: BW203.125 kHz, 250 kcomplex samples/s, 4-bit components, 500-ms windows. Separate fresh payload batches, four CRs, lengths 1/8/32; no RF retries. The 107th PSRAM attempt aborted on a ring edge. Only completed windows form plotted denominators. Two earlier PSRAM batches also aborted; see all retained raw reports. 100% reported output retention is not proof of every physical ADC sample, full-time coverage or continuous 4 MS/s USB.
