

A No-error IRQ + full CRC + exact bytes

B Separate evidence criteria

Actual fresh SF7 / BW203.125 kHz bench, 2440.125 MHz; four CRs × six lengths × ten shuffled blocks; no RF retries.
 16 exact payloads had simultaneous header-valid + latched header-CRC-error events; all were conservatively rejected.
 The payload CRC error bit was absent. Event attribution is unresolved; these are not 16 missing or payload-corrupt packets.
 Wilson 95% interval for strict acceptance: 89.45–95.86%, descriptive only; one stationary indoor pair, uncalibrated RF power.
